Docket No.: I431.169.101

Title: SEMICONDUCTOR HOUSINGS HAVING COUPLING COATINGS (as amended)

IN THE CLAIMS

Please cancel claims 1-24 without prejudice.

Please add claims 25-50 as follows:

WHAT IS CLAIMED IS:

1-24. (Canceled)

25. (new) A semiconductor housing comprising:

a leadframe which is intended to be equipped with a semiconductor chip and to be enveloped with a polymer material; and

a polymer layer applied as an adhesive layer to the leadframe and having end groups which are aligned toward the polymer material and end groups which are aligned toward a flat conductor, and the polymer layer comprising at least one polymer from the group of the fluorinated polyimides, the polyisocyanates, the polyamidocarboxylic esters of the polyamide-silicone block copolymers, the polyamide imides having silanes in the polymer chain or the polyimide-silicone copolymers having silanes in the copolymer chain.

26. (new) The semiconductor housing of claim 1, wherein the polymer layer comprises a fluorinating polyimide, and, to this end, a 10 percent by weight solution of a polyimide, composed of 2,2-bis[phenyl-3',4'-dicarboxylic anhydride]-1,1,1,3,3,3-hexafluoropropylene and 3,3',5,5'-tetramethyl-4-,4'-diaminodiphenylmethane in γ -butyrolactone or NMP and cyclopentanone with a γ -butyrolactone or NMP:cyclopentanone weight ratio = 1:2, is applied to the semiconductor component before the encapsulation process, selectively without spraying of the outer connecting pins and of the heatsink plate, with a suitable dispensing apparatus, in such a way that a layer thickness d where $0.05 \mu\text{m} \leq d \leq 5 \mu\text{m}$ is realized after the heat treatment process which follows.

27. (new) The semiconductor housing of claim 1, wherein the adhesive layer comprises polyamide imide whose acid groups have been condensed with amino groups of a silane,

Title: SEMICONDUCTOR HOUSINGS HAVING COUPLING COATINGS (as amended)

each 2nd to 10th free acid group of the polyamide imide having reacted chemically with an amino group of a silane.

28. (new) The semiconductor housing of claim 1, wherein the adhesive layer comprises a polyimide amide-silicone copolymer having silanes in the polymer chain, acid groups of the polyamide imide having been condensed with amino groups of a silane and every 2nd to 10th free acid group of the polyamide imide having reacted chemically with an amino group of a silane.

29. (new) The semiconductor housing of claim 1, wherein the polymer layer additionally comprises one or more of the following substances:

imidazoles;

liquid-crystalline polymers;

high-temperature-resistant thermoplastics;

phenol resins;

amino resins;

siloxanes;

unsaturated polyesters;

polybenzoxazoles;

polybenzimidazoles;

epoxides;

polyurethanes;

polymers with sulfur in the main chain; and

polymers with sulfur in the side chain.

30. (new) The semiconductor housing of claim 1, wherein the polymer layer has, in the main chains and/or side chains, additionally one or more of the following functional groups:

sulfone group;

mercapto group;

amino group;
carboxyl group;
cyano group;
keto group;
hydroxyl group;
silano group; and
titano group.

31. (new) The semiconductor housing of claim 1, wherein the polymer precursor comprises one or more copolymers.
32. (new) The semiconductor housing of claim 1, wherein the polymer precursor comprises a mixture of two or more polymers.
33. (new) The semiconductor housing of claim 1, wherein the polymer layer has one or more plies, each ply comprising one or more polymers.
34. (new) The semiconductor housing of claim 1, wherein the polymer layer comprises one or more of the following assistants:
- solvents;
adhesion promoters;
antioxidants;
catalysts;
reinforced fillers;
plasticizers; and
UV stabilizers.

Docket No.: I431.169.101

Title: SEMICONDUCTOR HOUSINGS HAVING COUPLING COATINGS (as amended)

35. (new) A semiconductor comprising:

an unencapsulated semiconductor component which is provided with a polymer material to envelope it; and

a polymer layer being applied to the unencapsulated semiconductor component and having end groups which are aligned toward the polymer composition and end groups which are aligned toward the flat conductor, wherein the polymer layer comprises at least one polymer from the group of the fluorinated polyimides, the polyisocyanates, the polyamidocarboxylic esters of the polyamide-silicone block copolymers, the polyamide imides having silanes in the polymer chain or the polyimide-silicone copolymers having silanes in the copolymer chain.

36. (new) The semiconductor of claim 35, wherein the polymer layer additionally comprises one or more of the following substances:

imidazoles;

liquid-crystalline polymers;

high-temperature-resistant thermoplastics;

phenol resins;

amino resins;

siloxanes;

unsaturated polyesters;

polybenzoxazoles;

polybenzimidazoles;

epoxides;

polyurethanes;

polymers with sulfur in the main chain; and

polymers with sulfur in the side chain.

37. (new) The semiconductor of claim 35, wherein the polymer precursor comprises one or more copolymers.

Title: SEMICONDUCTOR HOUSINGS HAVING COUPLING COATINGS (as amended)

38. (new) The semiconductor of claim 35, wherein the polymer precursor comprises a mixture of two or more polymers.

39. (new) The semiconductor of claim 35, wherein the polymer layer has one or more plies, each ply comprising one or more polymers.

40. (new) The semiconductor of claim 35, wherein the polymer layer comprises one or more of the following assistants:

- solvents;
- adhesion promoters;
- antioxidants;
- catalysts;
- reinforced fillers;
- plasticizers; and
- UV stabilizers.

41. (new) The semiconductor of claim 35, wherein the semiconductor component has a semiconductor chip and an envelope of a polymer material.

42. (new) A process for producing a leadframe which is intended to be equipped with a semiconductor chip and to be enveloped with a polymer material, comprising:

- providing a substrate and/or an unencapsulated semiconductor component;
- applying a suspension or a polymer precursor to the substrate and/or the unencapsulated semiconductor component; and
- obtaining a polymer layer by evaporating a solvent or by polymerizing the polymer precursor, the polymer layer comprising at least one polymer from the group of the fluorinated polyimides, the polyisocyanates, the polyamidocarboxylic esters of the

Title: SEMICONDUCTOR HOUSINGS HAVING COUPLING COATINGS (as amended)

polyamide-silicone block copolymers, the polyamide imides having silanes in the polymer chain or the polyimide-silicone copolymers having silanes in the copolymer chain.

43. (new) The process of claim 42, comprising:

applying a 10 percent by weight solution of a polyimide, composed of 2,2-bis[phenyl-3',4'-dicarboxylic anhydride]-1,1,1,3,3,3-hexafluoropropylene and 3,3',5,5'-tetramethyl-4,4'-diaminodiphenylmethane in γ -butyrolactone (or NMP) and cyclopentanone in a γ -butyrolactone (or NMP):cyclopentanone weight ratio = 1:2, selectively to the semiconductor component before the encapsulation process, in that the component thus coated is then heated from room temperature to 200°C in a nitrogen-purged oven using a temperature ramp (2-5°C/min), and in that the component is then cooled at 200°C for 60 minutes with evaporation of the solvent from the coating solution and enveloped with an encapsulating material composed of epoxy resin.

44. (new) The process of claim 42, comprising:

admixing 20 percent by weight solution of polyamide imide (PAI) with from 0.1 to 1 percent by weight of 3-aminopropyltrimethoxysilane in dimethylacetamide, NMP or γ -butyrolactone, and stirred at 80°C for 2 hours, so that the amino groups of the silane condense with the acid groups of the PAI in such a way that, depending on the amount of silane added, approx. every 2nd to 10th free acid group of the PAI reacts chemically with an amino group of a silane, in that the solution thus obtained is then diluted in any desired manner with cyclopentanone, anisole, acetone or similar solvents to a concentration of approx. 5 percent by weight (based on the silane-modified PAI), in that this solution is applied selectively to the semiconductor component before the encapsulation process, in that the component thus coated is heated from room temperature to 200°C in a nitrogen-purged oven using a temperature ramp (2-5°C/min) and is kept at 200°C for 60 minutes with evaporation of the solvent, and in that the component is finally enveloped with an encapsulating material composed of epoxy resin.

Docket No.: I431.169.101

Title: SEMICONDUCTOR HOUSINGS HAVING COUPLING COATINGS (as amended)

45. (new) The process of claim 42, comprising:

obtaining a polyimide-silicone copolymer having silanes in the polymer chain by selectively applying a polymer prepared with silanes and composed of silicone and polyamide imide as an approx. 5 percent by weight solution in NMP, cyclopentanone and acetone in a mass ratio of the solvents: NMP:cyclopentanone:acetone = approx. 1:2:2 to the semiconductor component before the encapsulation process, and in that a heat treatment process is carried out in which the component thus coated is heated from room temperature to 200°C in a nitrogen-purged oven using a temperature ramp (2-5°C/min) and is kept at 200°C for 60 minutes with evaporation of the solvent, and in that, after the component has been cooled to about room temperature, the component is enveloped with the encapsulating material composed of epoxy resin.

46. (new) The process of claim 42, comprising:

diluting a polyamidocarboxylic acid dissolved in from approx. 50 to approx. 90% by weight of N-methylpyrrolidone (NMP) and esterified with diethylene glycol methacrylate (polycondensed from the monomers pyromellitic anhydride and 4,4'-oxydianiline) with cyclopentanone in a ratio of approx. 1:20, in that this solution is mixed further with acetone or ethanol in a ratio of approx. 1:1, in that as a still unencapsulated semiconductor component is immersed into this solution for contacting of the semiconductor chip and its wires at an immersion rate of from approx. 0.5 to approx. 5 cm per second and pulled out again, in that the semiconductor component thus coated is subsequently stored in a magazine at about room temperature for from approx. 5 to approx. 500 minutes, in that this unencapsulated semiconductor component is then positioned for from approx. 15 to approx. 60 minutes in a forced-air oven under a flow of at least approx. 20 l/min of nitrogen with a set temperature of from approx. 80 to approx. 100°C, in that the temperature is then increased to approx. 250°C with a heating rate of from approx. 3 to approx. 5°C/min and is kept for at least approx. 60 minutes, and in that, after cooling (cooling rate from approx. 2 to approx. 5°C/min) of the coated semiconductor component in the oven with nitrogen purging to about room

Title: SEMICONDUCTOR HOUSINGS HAVING COUPLING COATINGS (as amended)

temperature, the semiconductor components thus coated are encapsulated with an epoxy resin molding material within approx. 48 hours.

47. (new) The process of claim 42, comprising:

admixing a solution of a polyamidocarboxylic ester with an NMP/cyclopentanone/acetone mixture with approx. 10% (based on the weight of pure polyamidocarboxylic ester) of N-(3-(trimethoxysilyl)propyl)ethylenediamine and stirred at approx. 120°C for approx. one hour, in that, in the course of this, the silane is polycondensed with another silane to give the silicone and, simultaneously with its amino group, partly with the acid groups of the polyamidocarboxylic acid to give the polyamide-silicone block copolymer, and secondly, with its amino group, partly with the acid groups of the polyamidocarboxylic acid, once the diethylene glycol methacryloyl side chains have been eliminated, to give the silane- or silicone-modified polyimide precursor, in that the solution thus prepared, after the contacting with the semiconductor chip and wire, is applied to the unencapsulated semiconductor component, in that the component thus coated is then stored in a magazine at about room temperature for from approx. 5 to approx. 500 minutes, in that this component is then positioned for from approx. 15 to approx. 60 minutes in a forced-air oven with purging with at least approx. 20 l/min of nitrogen at a set temperature of from approx. 80 to approx. 100°C, in that the temperature is then increased to approx. 250°C at a heating rate of from approx. 3 to approx. 5°C/min and this is kept for at least approx. 60 min; in that, after cooling (cooling rate from approx. 2 to approx. 5°C/min) of the coated semiconductor component in the oven with nitrogen purging to about room temperature, the semiconductor components thus coated are encapsulated with an epoxy resin molding material within approx. 48 hours.

48. (new) The process of claim 42, comprising:

immersing the semiconductor component, immediately before the polymer encapsulation, at an immersion rate of from approx. 0.5 to approx. 2 cm per second first into a solution of from approx. 10 to approx. 30% by weight of polyisocyanate in methyl ethyl
